From a candidate target to clinical evidence

	Biological dependency	Corresponding evidence
1	**Tumour alteration and expression**	Sequencing and expression support
2	**Presentation and T-cell priming**	Presentation assays and priming evidence
3	**Antigen-specific T-cell response**	Specified immune assays and longitudinal samples
4	**Tumour recognition and local function**	Tumour-cell recognition and tissue evidence
5	**Clinical outcomes**	Appropriate comparison: recurrence, survival, harms

Each transition needs support; a blood response is not a clinical outcome.
